

PRIVATE CONTROLS FOR PUBLIC MONEY · STELLAR

Nulth

Proof-authorized accounts for Stellar stablecoin treasuries and autonomous payment agents.

Money moves only when it proves it obeyed rules the chain never sees.

Nulth is a Stellar account layer where every payment carries a zero-knowledge proof that it obeys a **private policy** — spend caps, allowlists, and compliance limits — without publishing those rules on-chain.

THE PROBLEM

On-chain money has no private control layer.

PUBLIC POLICIES

Your strategy leaks

Caps, allowlists, and approvers written on-chain are readable by competitors and attackers. For a treasury, the rules *are* the strategy.

OFF-CHAIN LIMITS

Trust comes back

Enforcing limits in a backend reintroduces the trusted operator you were trying to remove — and the single point of failure with it.

AI AGENTS

Filters get jailbroken

When agents hold wallets, a prompt filter can be talked past. The spending limit has to be structural — enforced below the model.

WHY NOW

Stablecoin finance is going institutional — but controls are still built for humans.

- › **Stablecoin treasuries are going institutional.** Balances now demand real controls — caps, approvals, and audit trails.
- › **Agentic payments are emerging.** Software is starting to pay on its own; it needs a spending limit it cannot exceed.
- › **Protocol 26 makes it viable.** Native BN254 and Poseidon in Soroban make on-chain proof verification practical — a per-payment proof costs a constant 8.537% of the compute ceiling.
- › **Stellar rewards real utility.** The ecosystem values on-chain activity — new accounts, USDC volume, verifier calls — and Nulth drives all three.

THE SOLUTION

Proof-authorized accounts.

Nulth removes the Ed25519 spending key from the payment path. A payment clears only if the browser produces a **Groth16 proof** that the amount is under the cap and the destination is on the allowlist. **The proof is the signature** — the account verifies it natively and authorizes itself.

THE PRODUCT

Nulth Treasury — the first product on the primitive.

FOR OPERATORS

- › Deploy proof-authorized accounts
- › Set private caps and allowlists
- › Send policy-bound payments

FOR COMPLIANCE

- › Prove limits without revealing the limits
- › Export audit evidence
- › Keep vendor & counterparty strategy private

FOR AGENTS

- › Give AI agents payment ability with hard cryptographic ceilings
- › Prompt injection cannot create a valid proof

LIVE ON STELLAR TESTNET

Live on Stellar testnet — fire real attacks at it right now.

Live

Real proof-authorized USDC payments settle on testnet.

5/5

5 real attack cases in the Exploitation Deck — all rejected on-chain, 0 bytes moved.

46

Tests: 34 contract · 7 circuit · 5 end-to-end.

8.537%

Constant verify cost · 65,536-slot private allowlist · native BN254.

• Enforced by the math

DIFFERENTIATION

Payments stay public. The rules behind them stay private.

APPROACH	THE PROBLEM
Multisig	Rules are public
Backend limits	Trusted operator
Session keys	Usually public or app-specific
Confidential Tokens	Amounts only; rules stay public
Nulth	Hidden policy, trustless enforcement

Confidential Tokens hide amounts. Nulth hides rules. Together they make private treasury control possible.

MARKET

For stablecoin treasuries, fintechs, funds, and agentic payment platforms.

01

Cross-border fintechs

Africa and EMEA operators moving stablecoins under compliance pressure.

02

Treasury teams

Stablecoin balances that need caps, approvals, limits, and audit trails.

03

Funds & DAOs

Enforceable spending without publishing vendor lists, strategies, or counterparty limits.

04

Agent platforms

x402 and autonomous payment systems that need hard spend ceilings.

Documented outreach started: Fonbnk, Yellow Card, MoneyGram Fintech Solutions, Onafriq, and LemFi. Fonbnk responded with onboarding next steps; Yellow Card clarified B2B volume thresholds; MoneyGram confirmed receipt.

GO TO MARKET

Start with stablecoin infrastructure teams. Expand into agentic finance.

- 01 **Stellar community & SCF visibility** — ship in public, earn credibility, and build where proof-authorized payments are native.
- 02 **CV Labs mentor access** — use EMEA fintech, stablecoin, security, and institutional-banking mentors for warm intros.
- 03 **Design-partner discovery** — interview 5–10 stablecoin operators, cross-border fintechs, treasury teams, and wallet-infrastructure teams.
- 04 **Pilot with one treasury or operator** — move real policy-bound volume through one Nulth account after security review.
- 05 **SDK for wallets and agents** — turn the account primitive into a developer layer for wallets, payment apps, and AI agents.

Distribution beats tech. Nulth is treating GTM as seriously as cryptography.

Four tranches, ending on mainnet.

T0 · 10% · \$12k

Foundation

Ship the base

GitBook, STRIDE threat model, public docs, testnet metrics dashboard, and design-partner discovery.

T1 · 20% · \$24k

MVP

Multi-tenant treasury

Multi-tenant Nulth Treasury, account deployment flow, REST API, admin roles, and expanded test coverage.

T2 · 30% · \$36k

Testnet expansion

Compliance + SDK

Compliance dashboard, audit exports, TypeScript SDK, monitoring, and first design-partner account on testnet.

T3 · 40% · \$48k

Mainnet

Go live

External-review remediation, mainnet deployment, SDK v1, production monitoring, and one monitored pilot.

Security audit runs through the **Audit Bank pathway** and external review — funded outside this grant. Grant funds go to development, hardening, QA, docs, SDK, and mainnet deployment.

TEAM

Who's building it.

FOUNDER

Timothy Popoola · winszn

Founder & technical lead

Blockchain developer and security-focused builder. Previously shipped **FlowGuard**, a Bitcoin Cash vesting & treasury protocol. Leads Nulth's smart-account architecture, ZK authorization flow, product engineering, and security testing.

`flowguard.cash`

CO-FOUNDER

Ezekiel Kolapo · Anu

BD & go-to-market

Co-founded **Aboki**, a Naira-USDC on/off-ramp, with his team — hands-on fintech and payments experience that now drives Nulth's go-to-market. Leads ecosystem outreach, design-partner discovery, the fintech pipeline, and partnerships across stablecoin infrastructure teams, cross-border fintechs, treasury operators, and Stellar ecosystem partners.

`aboki.xyz`

AI-use disclosure: development is AI-assisted across implementation, tests, and documentation. The cryptographic design, circuits, and on-chain contracts are human-reviewed and verified with real tests and on-chain transactions. The agent feature uses an LLM only as an intent translator; the ZK proof is the authorization.

THE ASK

~\$120k in XLM — SCF Build · Open Track (Financial Protocols).

WHAT IT FUNDS

- › Product hardening and QA
- › Multi-tenant treasury infrastructure
- › SDK and API
- › Mainnet deployment after external review
- › Design-partner pilots
- › GitBook, monitoring, and metrics dashboard

WHAT STELLAR GETS

- › A new native account primitive
- › More proof-authorized USDC volume
- › More BN254 verifier calls
- › More Soroban smart-account deployments
- › Institutional-friendly treasury infrastructure
- › A credible path from testnet ZK primitive to mainnet usage

Private controls for public money.

Try the live demo — set a private policy, make a proof-authorized payment, then try to break it.
